4 Examples.....	2

## 1. Description

The Assembly data type represents an object of a Assembly base type.

## 2. Assembly

Attribute	Description	Required
name	The object name.	Yes
type	The object type name.	Yes
maprefuri	The maprefUri	Yes
description	The object description.	Yes
includeExistingResources	Boolean flag specifying whether to merge included entities with existing child resources.	No, defaults to true.

## 3. EntityReference

Uses one or more [EntityReference](#) elements to represent child resources.

## 4. Examples

Shows Assembly data type used in the [object-update](#) Ant task.

```

    <object-update depot="{entity.depot}"
      resultproperty="result"
      comment="Updated myAssembly object.">
      <assembly
maprefUri="http://www.opendepo.rog/DepOnt#AssemblySubtype_myAssembly"
        name="myAssembly"
        type="AssemblySubtype"
        description="my descriptive text."
        includeExistingResources="false">

          <entityreference maprefuri="{entity.mapref-uri}"/>
          <entityreference
maprefuri="http://www.opendepo.org/DepOnt#SomeType_19" />

        </assembly>
      </object-update>

```
